STEALTH Software and Caringo Partner to Simplify the Zimbra™ Message Store

Offers Trial Solution Available for Download

The Netherlands, Bunschoten, August 6, 2009 - STEALTH Software, a Dutch software development organization dedicated to enabling a broad spectrum of organizations to become operationally more efficient and effective, today announced the availability of **STEALTH Content Store for Zimbra™ Collaboration Suite**, using **Caringo CASTor™** as the infrastructure for message storage.

Caringo CASTor™ content storage in Zimbra™ Collaboration Suite

While email use has increased dramatically with the growth of the Internet, the underlying messaging systems most enterprises count on to keep pace were generally designed more than a decade ago. These older systems can be frail and challenging to run in today's frenetic environment. Zimbra is leveraging the strength of the open source philosophy to innovate enterprise communication:

- Transform email and collaboration to become more efficient
- Make administration and integration less painful

The Zimbra Collaboration Suite is comprised of many components working together as a complete end-to-end solution. It includes several data stores for end-user information. The Zimbra Data Store handles all preference and message meta data, and the Message Store uses the local Linux file system for physical message storage. The message store is where all email messages and file attachments reside.

The challenge, however, is that a Linux file system doesn't offer the most efficient way for storing unstructured binary content, is very costly to manage, unsecure and not easy to scale.

The solution, then, is using Caringo CASTor as a simple, cost-effective storage medium to function as a Zimbra Message Store. To coordinate the Message store, it's essential to implement the STEALTH Content Store for *Zimbra* Collaboration Suite, which uses simple semantics to recognize file commands and invokes redirection calls to CASTor™ when it recognizes message and file data objects.

SOFTWARE

“With social networks spanning both consumer and business communities, the requirements on content management are eminent, whereas traditional approaches can no longer deliver the sound economics for storing active and archive content”. “Again Caringo and STEALTH Software have demonstrated the leverage of their partnership, resulting in the co-development to integrate Content Store for Zimbra Collaboration Suite” said Osgar de Laat CEO of STEALTH Software. “Subsequently, this value stack is geared to manage cost-effectively all of social network content”.

“We are very excited about STEALTH Software’s solution enabling CASTor as a content store for Zimbra,” said Mark Goros, Caringo CEO. “The sheer overload in e-mail volume has made it difficult and complex for companies to deal with up to millions of messages every day and provide an affordable, scalable storage repository. This new solution solves a large challenge for organizations to become more effective at managing and storing e-mail.”

Caringo's disruptive CASTor technology is built on innovative object-based storage architecture, delivering the most complete set of features to address massive content storage as well as the growing requirements for compliance. It provides WORM storage, content integrity and authenticity meeting regulatory mandates such as SEC17a4 and HIPAA. CASTor is scalable, high performance and extremely cost effective content storage software that runs on standard, commodity x86 hardware enabling users to build massive storage clusters without the vendor lock-in of traditional storage products. The result is a clustered storage solution with unmatched scalability, data integrity, performance and reliability that dramatically reduces the TCO of enterprise storage.

About Caringo

Caringo Inc. is an innovative provider focused on delivering the most advanced object-based software technology for accessing, storing and distributing unstructured or file-based content. Its flagship product, CASTor, dramatically improves the scope and economics of content storage by enabling customers to implement robust storage clusters without being locked into proprietary hardware. Founded on the operating principle that things should be made as simple as possible and a customer-first focus, Caringo makes content and file storage affordable, scalable, fast and easy.
